Technical What's New

Welcome to the Autodesk Inventor 2012 Software Product Line

Easy, Fast, Open
We defined these three objectives for our latest generation of Autodesk® Inventor® products. These goals are reflected in the large number of enhancements in the latest version of the Autodesk Inventor product family. For you as a user, this means significant benefits and improvements for your daily work.

Autodesk Inventor 2012 sets new standards for ease of use in 3D modeling, providing the most straightforward methods of defining and modifying parts and assemblies. Inventor 2012 removes the complexity from the CAD experience - helping you focus on the problem you are trying to solve rather than spending time mastering techniques for creating 3D geometry and wrestling with complex dialogue boxes. Streamlined creation of advanced and compound shapes, simplified setup of simulation problems, new help and learning tools, faster and easier deployment, installation, and management for IT and CAD managers will enable you to achieve more in less time.

Inventor startup times have been cut in half. Drawing view generation is up to ten times faster. iLogic design automation now allows users to set up iLogic models much more rapidly than in previous versions. Autodesk Inventor 2012 opens up new opportunities for sharing and updating CAD data regardless of source, complexity, or context. You can now easily accept and repair model geometry without worrying about the source or complexity of the model. Inventor 2012 delivers enhanced visualization and BIM-ready content, allowing you to make better sustainable design decisions and improve mold base designs.

This brochure illustrates the most significant improvements in greater detail.

Digital Prototyping
This year, Autodesk has packed even more value into cost-efficient software suites for your digital prototyping tasks. Autodesk covers the entire process of digital prototyping with these suites. Since requirements are not the same at every company or in every department, you will find suites with different sizes and contents.

The new Autodesk Product Design Suites Premium and Ultimate replace the current Autodesk Inventor Suite and Autodesk Inventor Professional Suite packages. Customers with a current Autodesk Subscription will receive this valuable upgrade at no additional cost.

Autodesk Factory Design
The Inventor products are also included in the new Autodesk Factory Design Suites 2012 released late last year. The last page of this document shows a comparative overview of features and contents of the new product suites for designers and factory planners in the manufacturing industry. The suites have been developed to meet all the needs of developers of digital prototypes and virtual plants.

We want to enable you to create innovative and sophisticated high-quality products and stay ahead of the competition.

Your Inventor Team

Improved Productivity

New, Expanded Help

Autodesk Inventor Wiki: Optional

The new Help Wiki provides the most robust, relevant, and up to date information. In addition, the Wiki enables you to partner with Autodesk to share your knowledge with others. The online Help Wiki is the default help in Autodesk Inventor. If you are connected to the internet when you access Help in Autodesk Inventor, the Help Wiki displays. But it's your choice: If you deployed Autodesk Inventor, and during the deployment you disabled the Help Wiki, it is no longer the default Help.

Basic installed Help is always there

When you install Inventor, a subset of the help that contains customer favorites is installed by default. A basic Help of reference topics, tutorials for the new user, and a What's New are installed with the product. If you are not connected to the internet when you access Help in Inventor, and you did not download full Help, the basic installed Help displays.

Full Help download

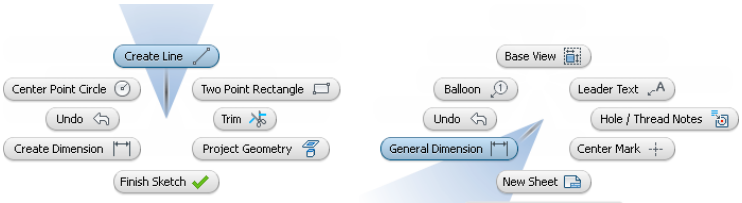
When you are not online, you can still have access to the full Inventor Help. Download a full Help from autodesk.com, Data and Downloads section. If you are not connected to the internet when you access Help in Inventor, and you previously downloaded full Help, the full Help displays instead of the basic installed Help.

Inventor Essentials Videos

The Inventor Essentials Videos demonstrate fundamental workflows in an illustrative and easy-to-understand way for new users. The videos include:

- Overview
- User Interface
- View Navigation
- Part Creation
- Sketching
- Assembly Creation
- Drawing Creation

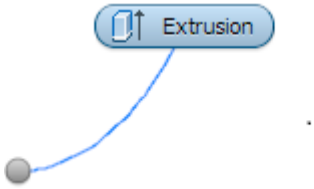
Marking Menu



The marking menu replaces the right-click context menu. You can perform a selection from the marking menu in either menu mode or marking mode.

Menu mode
Right-click in the graphics window. Menu items surround the cursor and each item, or the command name and corresponding command icon display. To dismiss the marking menu, click once again in the center of the menu display.

Mark mode (also called gesture behavior)
Draw a mark. To enter this mode, press and hold the right mouse button, and immediately move the cursor in the direction of the desired menu item. A trail follows the cursor. Release the mouse button to select and execute the command that corresponds to the direction of movement of the cursor.

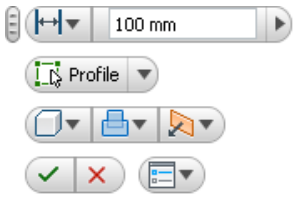


The marking menu helps to indicate next steps in a process and identify further options to facilitate workflow. Additionally, it greatly reduces mouse motion and is easily customizable to suit user preferences.

Custom Settings Now Combined in a Single File

Previous Inventor versions stored customized ribbon and keyboard settings in separate XML files. In Autodesk Inventor 2012, customization settings for the ribbon, keyboard, and the new marking menu are stored in a single XML file. This new convention makes it easier and faster to restore customized settings when you install a new version of Inventor. It also facilitates sharing customized settings between different computers or with other users in your organization.

Enhanced Mini-Toolbars



Inventor 2012
Extrude Mini-toolbar

Inventor 2011
Extrude Mini-toolbar

The mini-toolbars are larger, easier to interpret, and feature greater functionality. Mini-toolbars are added for the following commands:

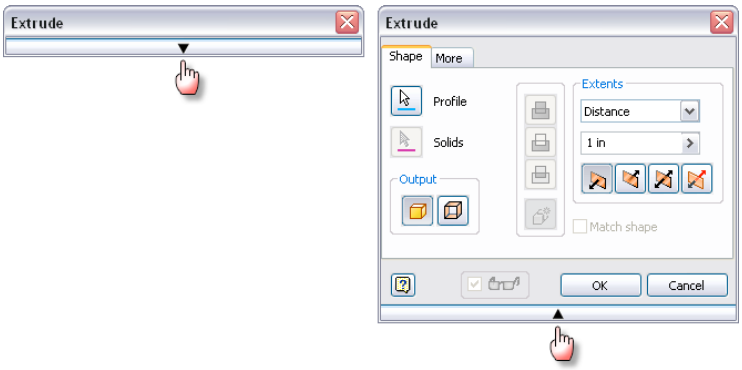
- Extrude
- Revolve
- Chamfer
- Fillet
- Hole
- Face Draft

There are two new mini-toolbar options:

- **Pin Mini-Toolbar Position**
  Use the grip button at the upper left of the mini-toolbar to move any mini-toolbar to a different location. You can pin the mini-toolbar so that it remains stationary in the graphics window.

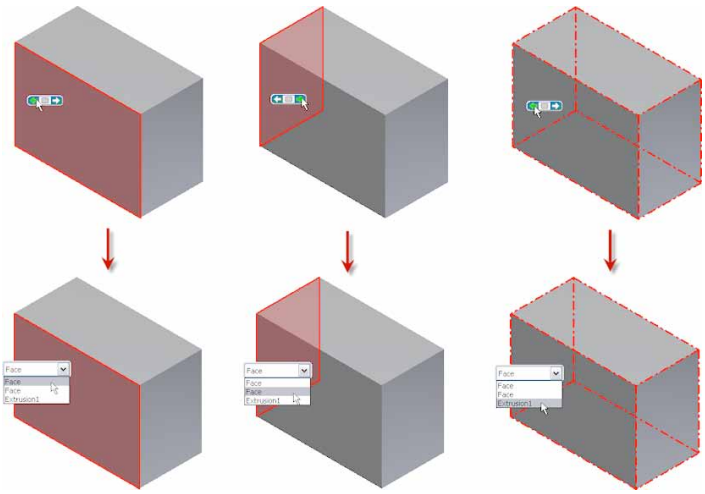
- **Auto Fade**
  When this option is enabled, if you move the cursor away from the mini-toolbar, it displays in a minimized state. When disabled, the entire mini-toolbar displays, regardless of the cursor position.

Dialog Boxes



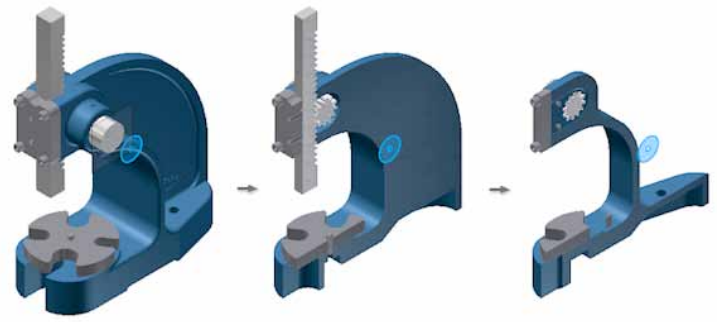
You can now expand and collapse dialog boxes easily: To expand, click the down arrow at the top of the dialog box. To collapse, click the up arrow at the bottom of the dialog box. This feature increases available work space in the graphics window. It reduces mouse motion and enhances your focus on the mini-toolbar command options.

Select Other – Behavior Improved



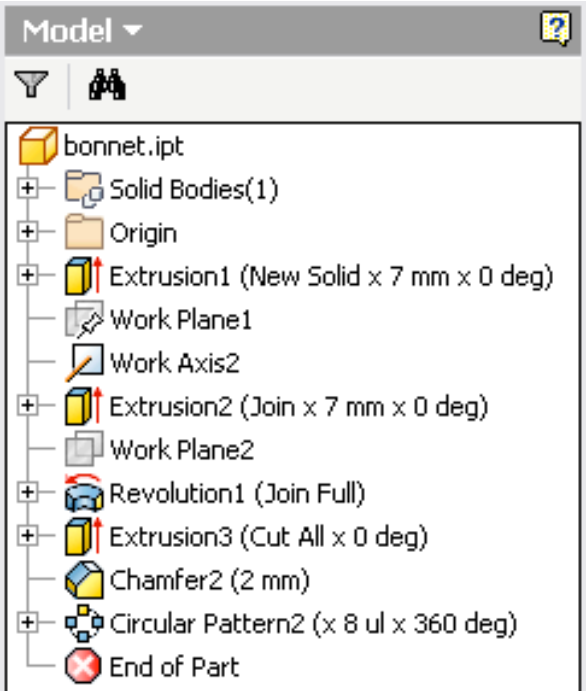
The Select Other procedure in previous Inventor versions required you to hover your cursor over an object, and then click the left or right arrows to toggle between adjacent faces, edges, and features. Hovering your cursor over an object in Autodesk Inventor 2012 presents you with a drop-down menu listing all available selection options. You can eliminate guesswork and speed the selection process by making your selection directly from the list.

Dynamic Sectioning



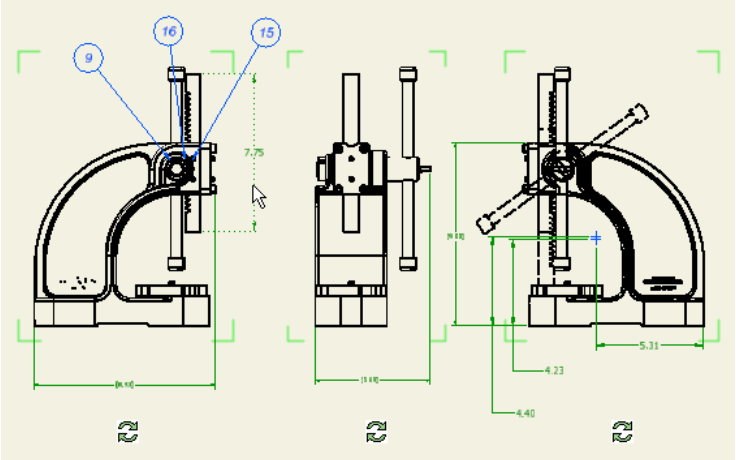
You can offset section planes in a part or assembly section view. Right-click, and select Virtual Movement ➤ Section Plane 1 (or Section Plane 2). Then: Drag the section plane to the desired position. Specify on offset in the Offset dialog box. Place the cursor on the Offset dialog box, and rotate the mouse wheel to move the section plane.

Extended Feature Names



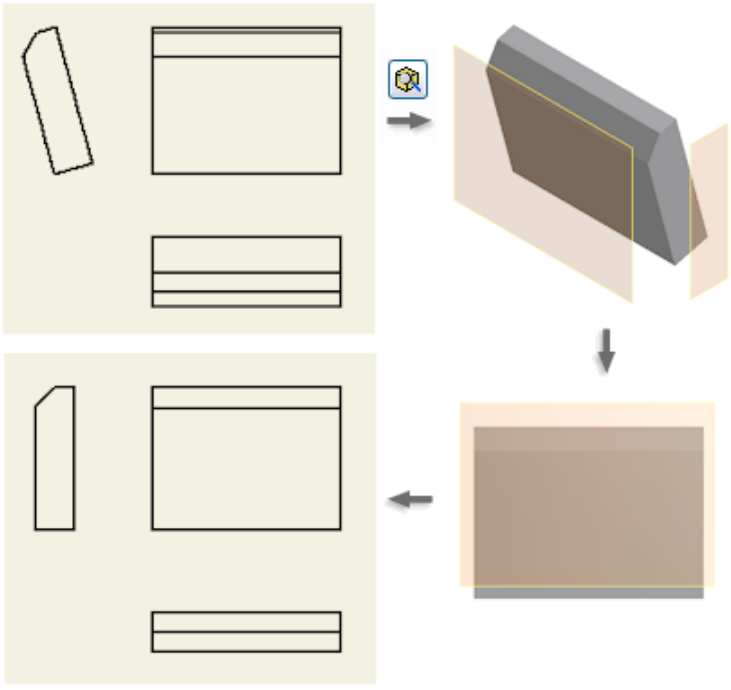
In the Model browser, the names of part features can be extended with information about feature parameters. Extended feature names enable better identification of existing part features.
To display extended feature names, on the Browser Filters menu , select Show Extended Names. Extended feature names are displayed in the Part, Sheet Metal Part, Assembly Modeling View, and Drawing environments.

High Speed Drawing Views



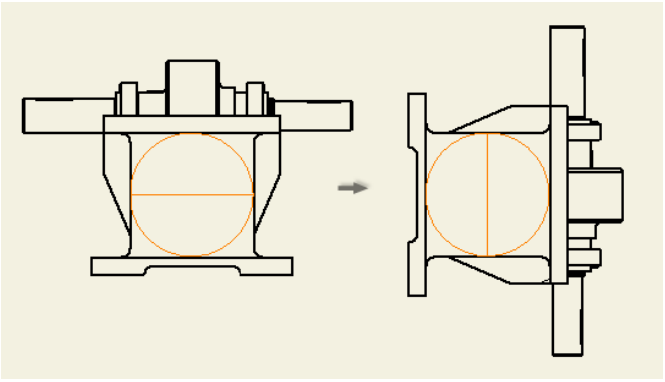
The generation of drawing views is up to ten times faster than in the previous version through multi-core support. Precise views are generated in parallel by leveraging multi-core technology. You can review the drawing or create drawing annotations before precise calculations of drawing views finish. Precise drawing views are calculated in the background while you work with draft previews (raster views). Raster views are marked by green corner glyphs in the graphic window, and by a special icon in the browser. If you place the cursor on a raster view icon, a tooltip showing the progress of precise calculation displays.

Change View Orientation



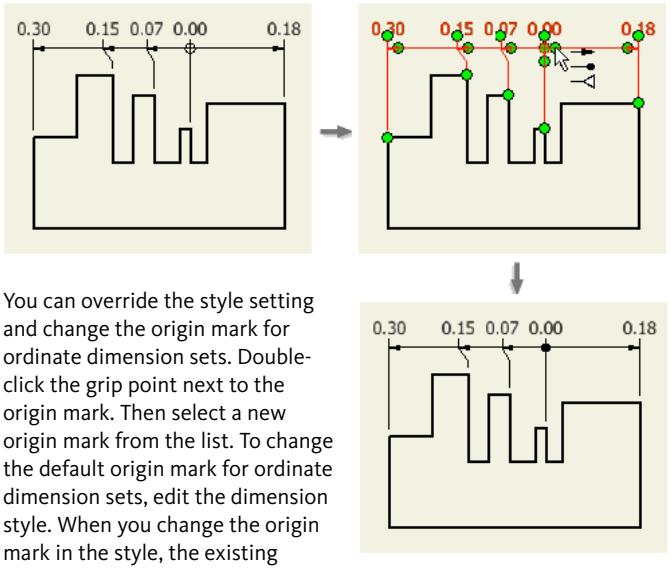
You can now change the orientation of existing drawing views with only a few clicks. Double-click a view, and in the Drawing View dialog box, click Change View Orientation. Then, in the Custom View window, specify a new view plane. When you change the orientation of a base view, all dependent child views inherit the new orientation.

Rotate Drawing Views with Sketches



The Rotate View command is available for drawing views that include sketches. Only sketches that are constrained to projected model geometry rotate correctly with the drawing view.

Origin Mark for Ordinate Dimension Sets



You can override the style setting and change the origin mark for ordinate dimension sets. Double-click the grip point next to the origin mark. Then select a new origin mark from the list. To change the default origin mark for ordinate dimension sets, edit the dimension style. When you change the origin mark in the style, the existing ordinate dimension sets with By Style origin mark display the new mark.

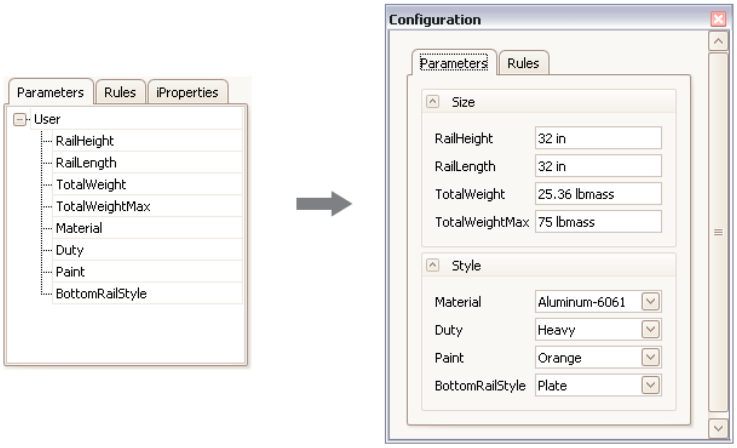
Wizard to Copy iLogic Designs

The new version provides a wizard to copy an Inventor iLogic template project. Use an Inventor iLogic project as a template to produce design variations. Embed design copies as subassemblies in larger designs, or as copies of a unique and complete product definition and save considerable time compared to the previous method.

Features include:

- Selects linked documents automatically.
- Copy files to a new or existing project destination.
- Copy Inventor and non-Inventor files.
- Rename file copies by defining a naming prefix, suffix, or both, that can be applied globally to the copy set.
- Set the Part Number (iProperty) of the copy destination file the same as the copy file name.
- Remove iLogic rules from Inventor documents included in the copied set.
- Use even if the documents do not involve iLogic rules.

Custom User Interface Forms to Automate Rules-Based Design



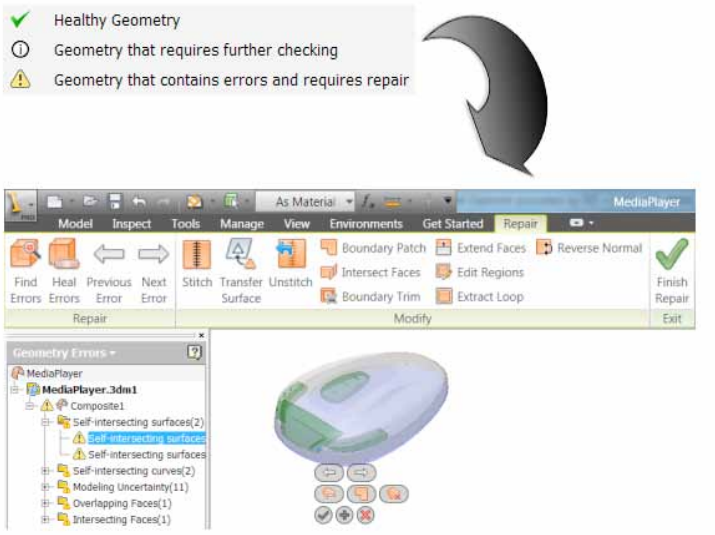
Design your own user interface using drag and drop methods in a fraction of the time it took to use programming methods. Create a custom form to drive the model. You can use the controls in the forms to drive changes to an existing design. Either save form definitions with a design document, or store them for use across multiple documents. Create and connect the custom user interface to the parameters, properties, and rules of an Inventor part, assembly, or drawing document.

Impressing Views Using New Ray Tracing Option

Ray tracing is added as a view setting option for the Realistic (default: enabled) and Monochrome (default: disabled) visual styles. If you select Realistic, the display refreshes using ray tracing. You can interrupt the process with the Orbit command, after which the display refreshes with ray tracing again.

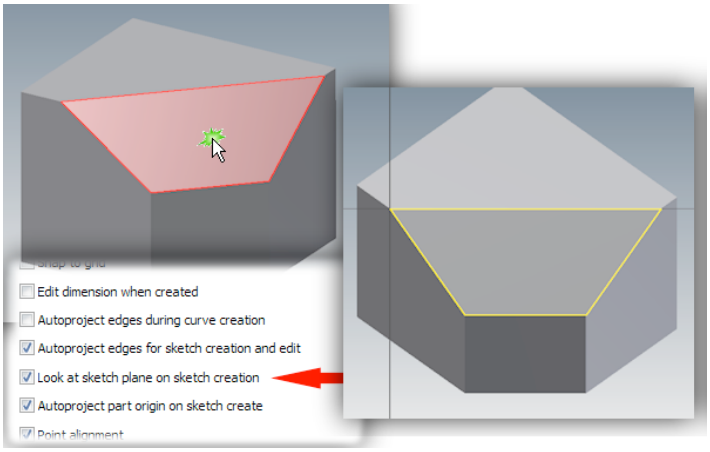
Enhanced Modeling

Model Repair Tools



Importing data often leads to deficient models due to peculiarities of the source systems. In Autodesk Inventor 2012 the problems can be solved in most cases: Inspect and repair imported data in a repair environment for imported files. Then the imported data is reliable in downstream modeling operations.

2D Sketch Plane Automatically Adjusts Orientation

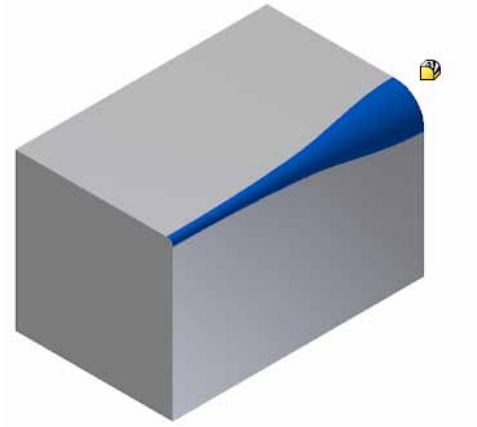


The View default behavior for 2D sketches is changed. When you start a sketch on a component face, the view orients so that the sketch plane normal points at the display. The sketch plane is parallel to the display, and is ready for sketching. You can change the default behavior in the Application Options.

New Boundary Patch Command

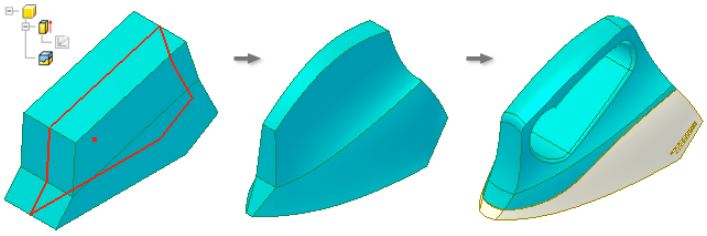
The option to generate a G2 (smooth) boundary patch is added to the part modeling and repair environment. Use a G2 transition to eliminate visible seams between surfaces.

G2 Continuity with Variable Radius Fillets



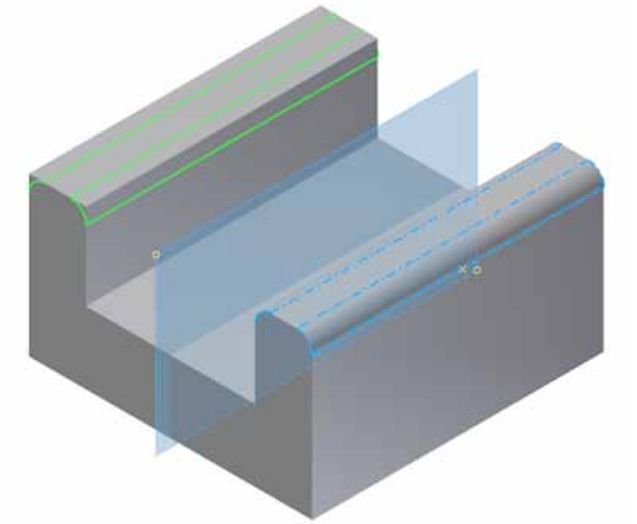
Variable radius fillets support G2 control. Use a G2 transition to eliminate visible seams between faces.

Edit Alias® Freeform Body



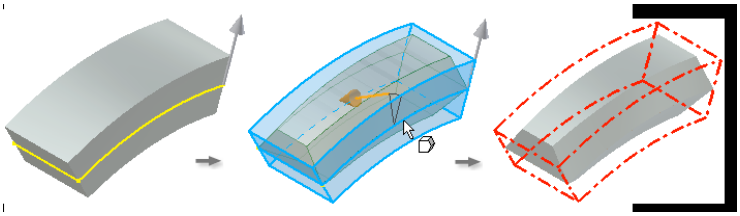
Launch Inventor Fusion from within Inventor using Edit Form or Edit Copy of Form. The Edit Form command creates an Alias® Freeform body which is then loaded into Inventor Fusion. You can modify the body using any of the Fusion commands then return the geometry to Inventor. Inventor Fusion now contains many of the commands previously available in Alias Design for Inventor. These features provide technology to reshape solid body edges and patches, transforming geometric forms to more organic ones.

Mirror Fillets



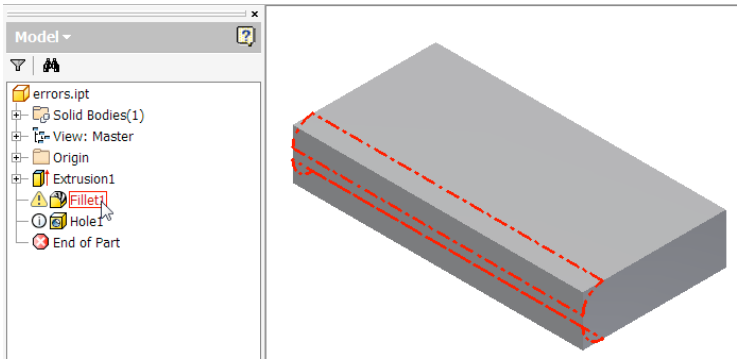
Fillet features can now be mirrored without including the parent feature. You can create symmetric models using fewer features.

Face Draft Enhancements



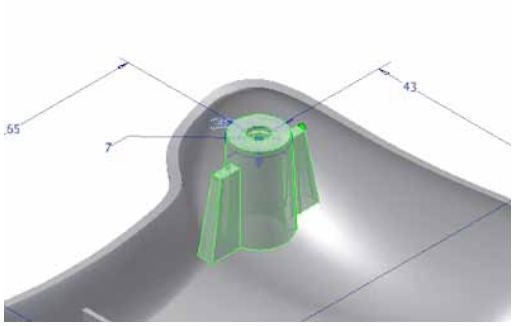
Controls are enhanced in the Draft command for adding draft to a model. These controls speed the creation of draft features and make it possible to create geometry that previously required multiple features.
Create a draft feature using a parting line (2D or 3D sketch) to position the start of the draft. Use separate angle values above and below the parting line or fixed plane. With Automatic Face Chain enabled, faces tangent to the selected face are included in the draft. Automatic Blending is available for adjacent faces that blend with a fillet or other feature. Turn on Automatic Blending to maintain blended geometry. Direct Manipulation controls are included with the Draft command.

Display Failed Feature



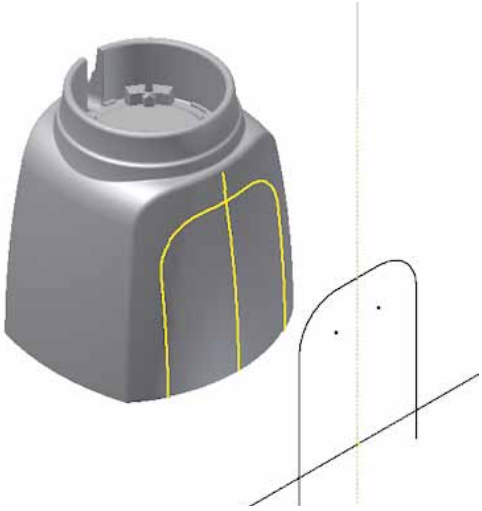
With Inventor 2012, you can locate failed features easily for problem solving. In the browser, pause the cursor over a failed feature to highlight it in the graphics window in its last successful state.

Boss Enhancements



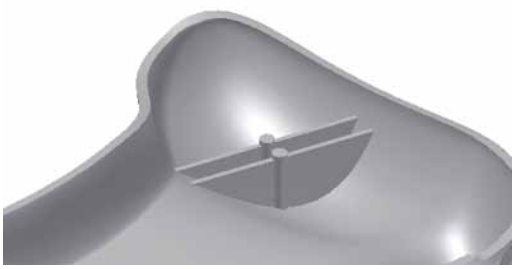
With new controls, you can create geometry in a single boss feature that would require multiple features previously.
A Boss feature is placed at a point centered on the mating face of the head and the thread. To change the position of a Boss placement, in the Offset From Sketch field, enter a value. The Angle to Fill field controls the position of ribs on the boss feature. You can create designs that do not require ribs to go 360 degrees around the boss.

Project to 3D Sketch



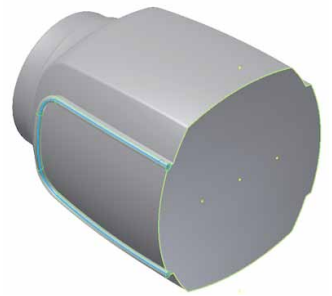
While working in a 2D sketch, you can preview 3D sketch geometry. The Project to 3D Sketch command projects geometry from the active 2D sketch and onto selected faces to create a 3D sketch.
With the command active while you modify a 2D sketch, the new geometry displays in a preview. After you finish the 2D sketch, the 3D sketch is created. The projected geometry is associative and updates with the parent geometry. You can disassociate the projected geometry by editing the 3D sketch and using Break Link.

Rib Enhancements



The Rib command dialog box is now enhanced with better organization and additional functionality. With the new functionality, you can create geometry that was not possible previously in a single feature.
When creating webs (feature is extruded normal to the sketch plane), Draft and Boss tabs are available. An option is available to specify the thickness at the sketch or at the root of the rib feature. While you create rib features, a realistic preview displays.

Sweep Along Edge



Edges of geometry are now valid selections for the sweep path. When you create the sweep feature, the edges project onto a new 3D sketch.

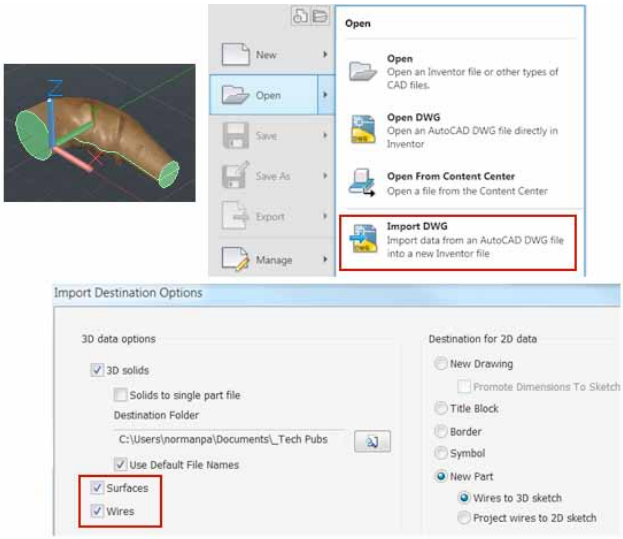
Design View Representations in Parts

In part files, design view representations store information related to the part view, such as part color, work feature visibility, and camera position. The browser provides access to design view representations.

Technical What's New

Improved Interoperability

AutoCAD Import



Several new options improve interoperability with AutoCAD®.
On the Open flyout, select Import DWG to bypass the Options setting. In the file import wizard, the final dialog box contains options to import AutoCAD Surfaces and Wires. To enable the Surface and Wire selection, select New Part. Materials applied in the AutoCAD file persist in the Inventor file after translation.

Updated Translators

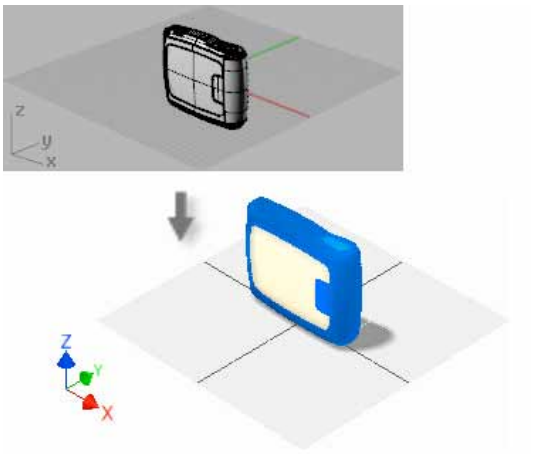
The following translators support newer versions of the file format:

CATIA V5
- Import: R6 - R20
- Export: R10 - R19

Parasolid
- Import: up to version 23.0
- Export: versions 9.0 - 23.0

NX
- Import: versions 3 - 7.5

Rhino File Translation



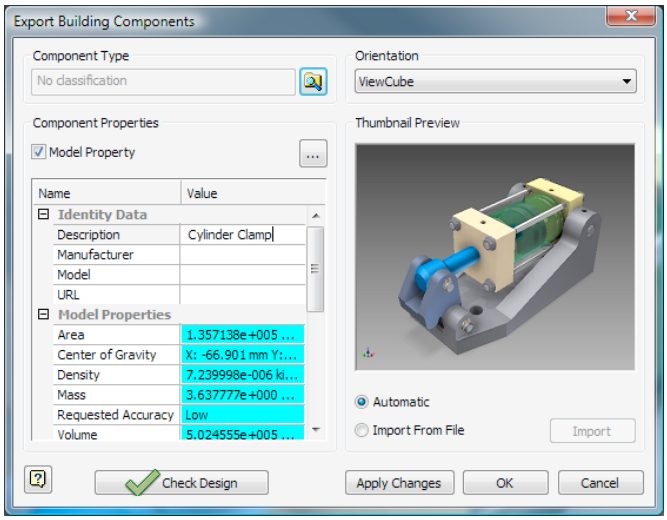
Rhino (*.3dm) files can be imported for use in Autodesk Inventor. The import operation does not maintain associativity with the original file. After the import operation: Changes to the original file do not affect the imported part. Changes to the imported part do not affect the original file. You can change the model as if it had been created in Autodesk Inventor. Use the Repair environment to heal models and fix surfacing errors.

BIM Exchange

General Improvements

If you are working frequently with colleagues in the various building fields, these new features are important for you. Inventor 2012 provides several integration improvements for BIM (Building Information Modeling) Exchange: iPart and iAssembly table access allows you to change between members. Export of Building Components makes data exchange easier. Connector access and workflows are improved. The various changes are outlined in the following.

Export Building Components



Before you export the component, provide all inputs and selections, and then click Apply Changes.

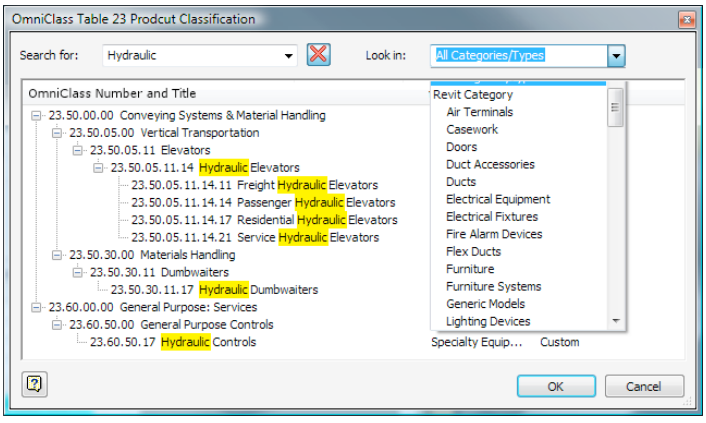
- To exclude model properties, clear the Model Property check box. When Model Property is selected, model properties are exported with the component.
- The model orientation options include ViewCube. The ViewCube „views" generate component views when exporting. When the model is opened in Revit, the ViewCube positions sync with the Revit ViewCube.
- To redefine the ViewCube origin point, use the triad. Select a component vertex or work point as input for the origin point.
- Thumbnail images are the isometric view of each orientation option. Each orientation option has an associated image. The images reflect what you see in the display. Use View settings for shadows, ground reflections, and lighting to produce a high quality thumbnail image.

BIM Connectors

Several improvements have been made to BIM connectors. The connector improvements include:

- Parameters use Inventor unit formatting.
- Parameter values can be included in the parameters table by checking the box in the fx column.
- For numeric parameters, the Inventor fly out menu is added providing access to Measure, Show Dimension, List parameters, and Most Recently Used (MRU) options.
- Parameters that are identified for export in the model parameter table are included in the export building component process.
- Inventor size parameters are associated with the Revit Length type.
- Connector parameters are included in the Design Check and display an icon and are colored red when invalid. If you use Export Building Components without doing the Design Check, it is run automatically and reports any invalid connector parameters. The connector browser icon updates to note the invalid connector.
- Suppressed connector nodes and text display their suppressed state.
- Exported connector parameters are accessible in the iPart Author and can be used as keys in the iPart or iAssembly.
- Promote Component Connectors enables exposing the sub-component connectors in the parent assembly. Connector links are not promoted, but can be added. Promote Component Connectors is accessible from the connector folder browser node context menu.
- After promoting connectors, you can exclude individual connectors by unselecting Include in the context menu.
- From a promoted connector you can locate and select the Source Component via the context menu. The source component is selected and highlighted.
- Promoted connectors are included in the Design Check.

OmniClass Table



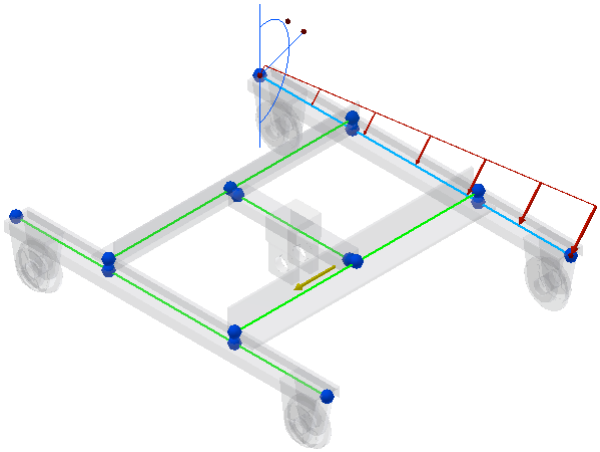
OmniClass is a classification scheme of international organizations (ISO and ICIS) for the building industry. It is under development since 1990. The new OmniClass Table dialog box provides an improved means of locating the Revit class for your BIM content. Revit and AME MvPart types are synchronized. A Look in option is available to refine category filtering. Table context menu options control column display.

Simulation Enhancements

Retain Joints

When joints are built automatically from assembly constraints, you can retain them in the model when the translator is turned off. You have the opportunity to both customize the standard joints built from constraints and author new standard joints, without starting from scratch.

Continuous Load Improvements

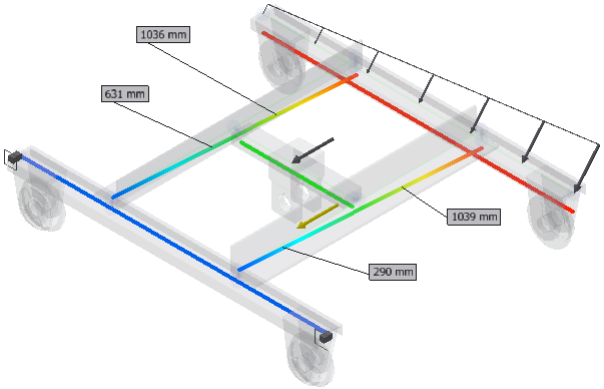


Enhancements are added to help you define the start and end magnitudes of the continuous load. Placement options are expanded with relative and absolute definition of offset.

In the Frame Analysis environment:

- Define the end magnitude as well as the start magnitude of the continuous load.
- The Checked Custom size option enables you to specify the offset and length of the load on the selected beam.
- Define offset using the absolute or relative values.

Frame Analysis Probes



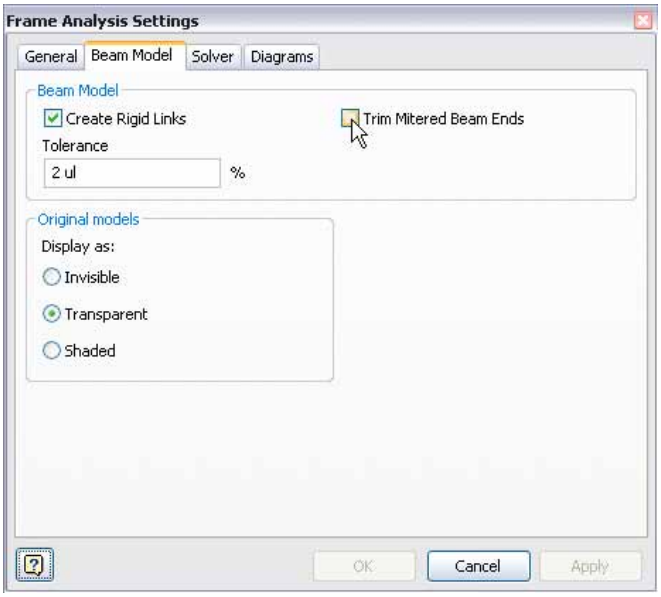
New Probe and Probe Labels commands enlarge the list of tools for viewing simulation results. The commands help you to:

- Create probes for selected simulation results.
- Control the visibility of probe label in the graphics window.

You can create one or more probes when any simulation result is active, and then switch between results to see values. Run the simulation, select Probe, and click a node or any position on the beam in your model. Created probe annotations are displayed when any result is active. Click Probe Labels to toggle the probe visibility.

Technical What's New

Beam Model Improvements



In the Frame Analysis Settings dialog box, Beam Model tab, two options are added:

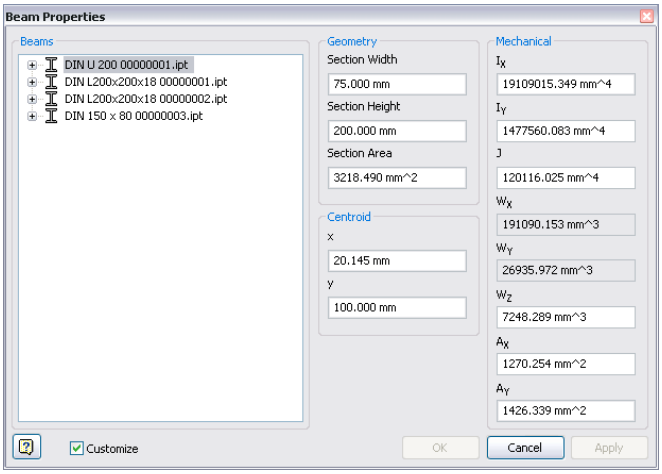
Create Rigid Links

When selected, you are increasing the flexibility to adjust the beam model during automatic conversion. When the check box is cleared, rigid links are not automatically created during model conversion. Instead, you can create rigid links manually according to your needs and preferences.

Trim Mitered Beam Ends

When you select this option, the overlaps are trimmed during automatic model conversion. It simplifies the generated model and improves the accuracy of the simulation results.

Customization of Beam Properties



You can edit an increased number of beam mechanical properties, including two new properties: Reduced Shear Stress (Ax) and Reduced Shear Area (Ay).

At the bottom of the Beam Properties dialog box, check Customize, and then enter your values. It allows you to fully define, or control the section properties.

Sign Convention in Frame Analysis Results

Stress results were unified to use the same sign convention as the Stress Analysis results. The interpretation of Frame Analysis results is now consistent with Stress Analysis results.

Geometry Healing and Meshing

Enhancements in the geometry healing and meshing operations for stress analysis mean increased success in analyzing complex designs.

In consumer products and some other industries, product designs involve many surfaces and tight tolerances. You can simulate the behavior of such designs before you build a physical prototype.

Guide

The improved content and interface in the Stress Analysis Guide help you to find the answers you need, whether your skills are novice or intermediate.

In-canvas Tools

New Marking Menus are present in all Simulation environments. These menus provide immediate access in the canvas to the most commonly used commands.

Analyze Sustainability early in the Design Cycle

Eco Materials Adviser

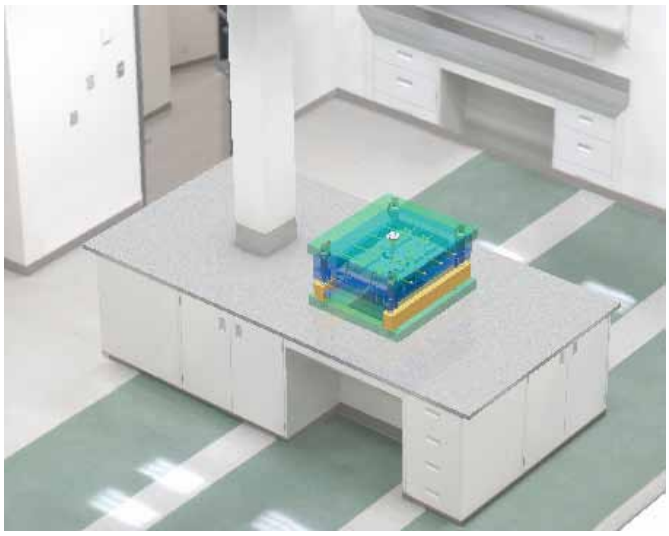
The Eco Materials Adviser tool enables you to analyze the environmental impact of your product early in the design process. The analysis provides rapid estimates of key environmental indicators such as energy usage, CO_2 footprint, water usage, compliance with European Restriction on Hazardous Substances (RoHS), end of life, and material cost, that are influenced by your material and production process choices. By browsing and selecting from the hosted materials database from Granta Design, you can then assign and evaluate alternative materials, to help minimize overall environmental impact.

The base version of Eco Materials Adviser which is included in Inventor can analyze assemblies of up to 20 parts, and uses a starter database of typical materials. To analyze an unlimited number of parts and to get access to a more comprehensive materials database, you can upgrade to the full version of Eco Materials Adviser that is offered by Granta Design. Click here to obtain more information.

The tool is accessible from the Environments tab in parts and assemblies. Eco Materials Adviser was developed as a joint partnership between Autodesk and Granta Design.

Tooling

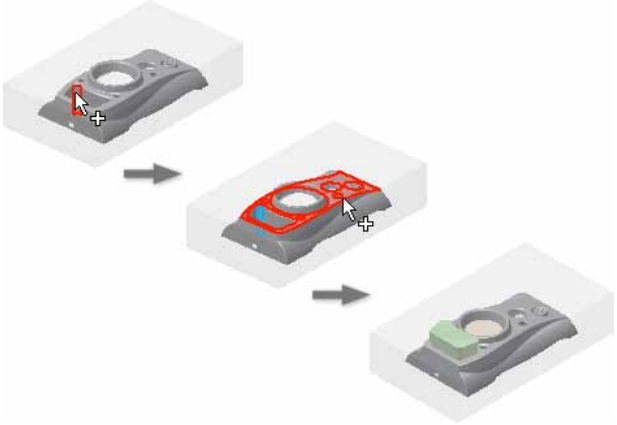
General Enhancements



The following productivity improvements are added to Inventor tooling:

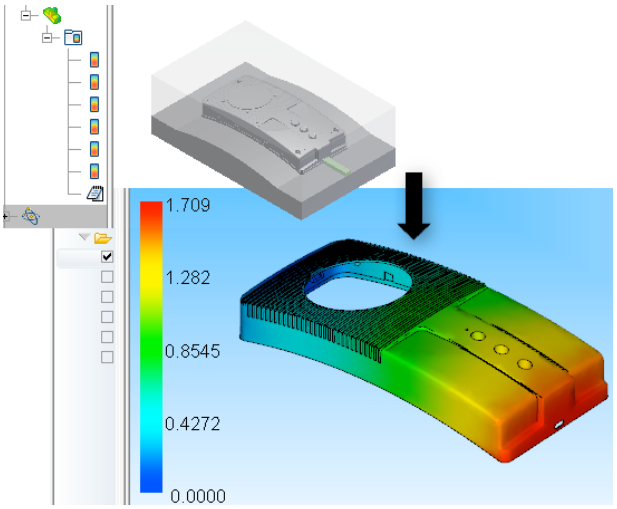
- Graphics processor support is added for Moldflow analysis.
- You can place the locating ring before you place the sprue bushing.
- Expanded LKM moldbase content is added to the library.
- A preview graphic is added to the Adjust Orientation command.
- You can stop the automatic surface patch or runoff surface operation at any time during creation.
- Edit coordinate system is added to the Ejector dialog box to redefine the origin and XY orientation.
- Error messages are expanded and enhanced in many areas to provide a clear understanding of the error.
- You can specify the vendor and category for library components such as ejectors and sliders before you query the content.
- The Combine Cores and Cavities dialog box contains a preview enable/disable check box to speed dialog box display time.
- To reduce install time, only a subset of the Inventor Mold Metric desktop content library is included on the installation disk. Download all of the available content from: www.autodesk.com/inventor-tooling-mold-libraries.

Select Faces to Create an Insert Automatically



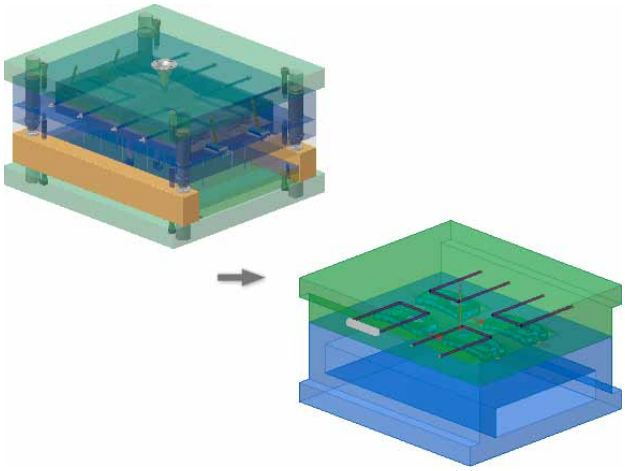
You can use the By Shape method to select all the faces required to create an insert automatically. Use the Face Set Tool selectors to select the Seed and Boundary faces. If the boundary faces are adjacent to the seed face, check Automatic profile loops before selecting to chain the faces.

Tooling Analysis Results in Moldflow Communicator



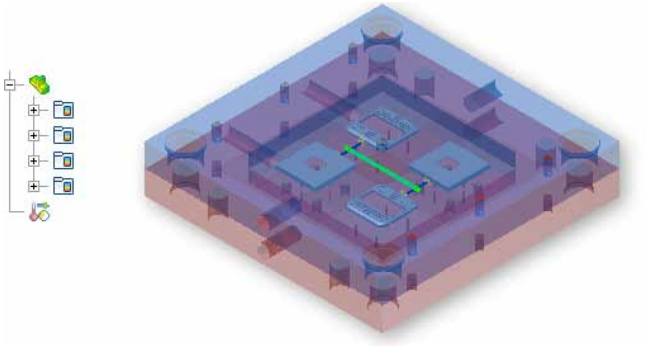
You can export analysis results to a Moldflow Communicator file.
With Moldflow Communicator, a free viewer, others on the design team can visualize, quantify, and compare simulation results. Sharing the data improves collaboration with the extended design team.

Export 3D Model to Moldflow Insight



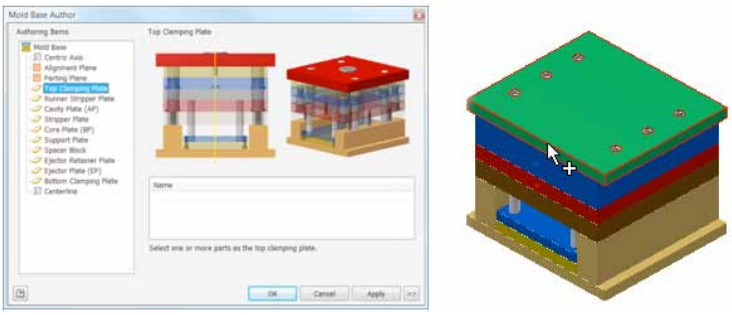
You can export the 3D mold base information to Moldflow Insight for cooling analysis.
The mold block is exported by default. Specify the inserts, cooling system and components to export.
If necessary, you can add hose definitions in the dialog box before export. The export process removes unnecessary hole features from the core/cavity solid. Open the file with Moldflow Insight to validate and optimize plastic parts, injection molds, and the injection molding process.

Runner Balancing



If Moldflow Adviser is installed on the system, you can use the Runner Balance command to perform a runner balance analysis on a multi-cavity or family mold design. After the analysis completes, apply the results to balance the flow into each cavity and achieve uniform part quality.

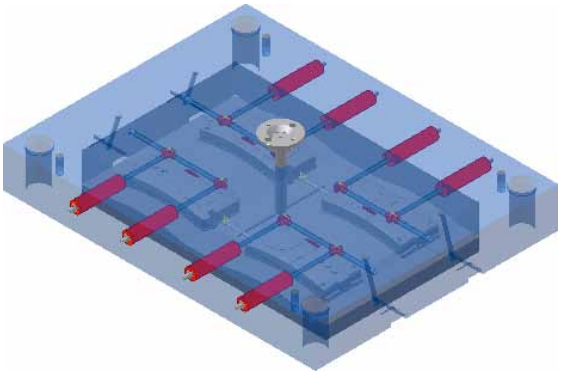
Mold Base Author



The command Mold Base Author identifies the members of an assembly as mold base components, and specifies the alignment options and mold base structure. This command is available in two locations:

- In an assembly, choose the Manage tab, Author Panel.
- In a mold design, choose the Mold Assembly tab, Author panel.

Cooling Channel Check



Use the Cooling Channel Check command to analyze the distance between cooling channels and other elements of the mold base.
Specify the Minimum Distance and then check for clearance, spacing, interference, and other violations.
Right-click an error in the report and use Find in Window to locate the error in the graphics window.

The Cooling Channel Check supports three types of checking:

- Safety Check 
- Interference Check - Cooling System Check 
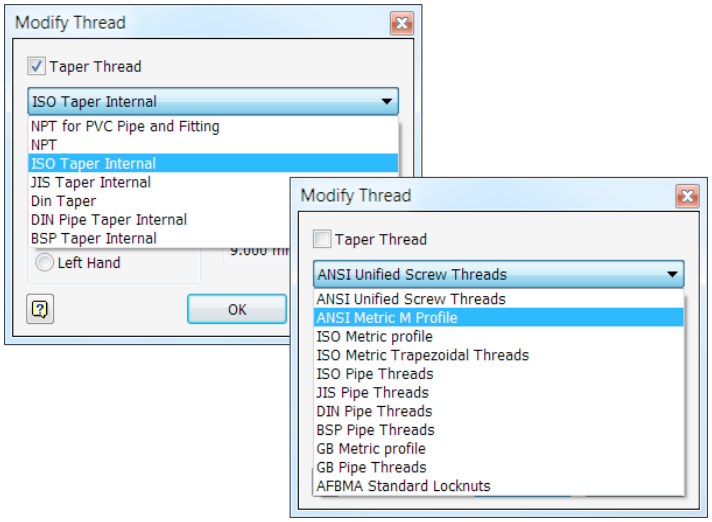
Cooling Channel Metric Threads

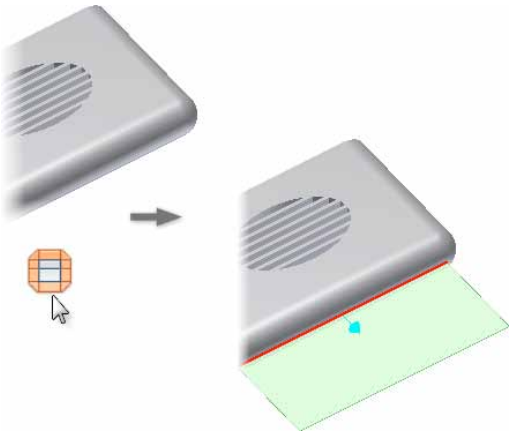


You can use metric threads in the cooling channel. To list the tapered thread options, select Taper Thread. To list straight thread options, clear the check box for Taper Thread. To modify the available sizes and set the default selections, edit the Thread.xls file.

Surface Patches with Sketch Geometry and Silhouette Curve

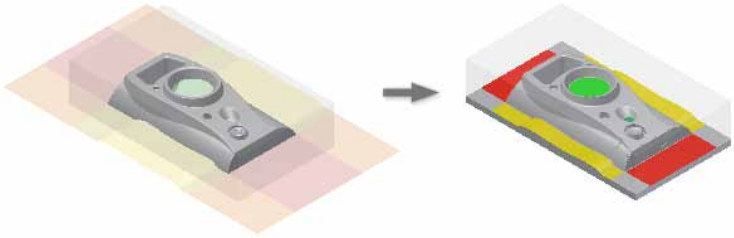
You can use any combination of 2D or 3D sketch geometry and silhouette curves to create surface patches.
To generate a silhouette curve, start the patching surface command and select a face where no edge exists. The curve is used with 2D or 3D sketch geometry to create a surface patch.

Runoff Surface with Sketch Geometry and Silhouette Curve



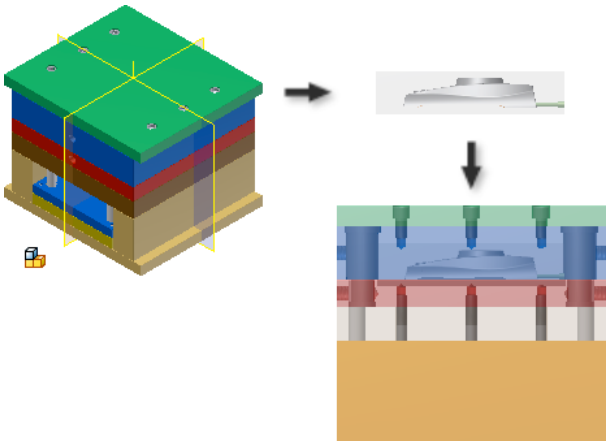
You can use any combination of 2D or 3D sketch geometry and silhouette curves to create runoff surfaces. To generate a silhouette curve, start the runoff surface command and select a face where no edge exists. The curve is used with 2D or 3D sketch geometry to create a runoff surface.

Patching and Runoff Surface Color



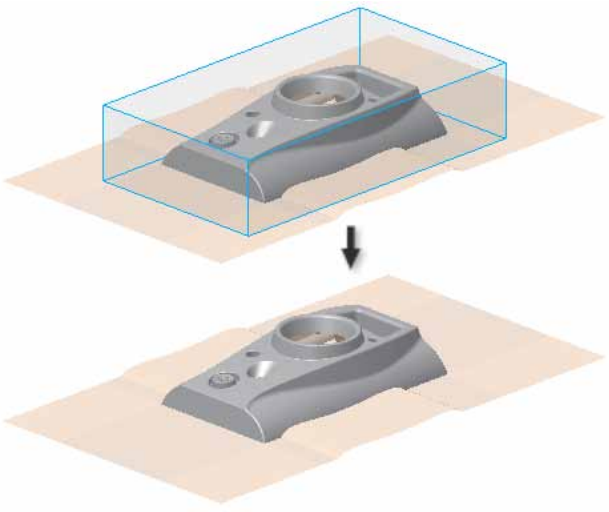
You can control the color of patching and runoff surfaces. Before you create the core/cavity, right-click a browser entry, select Change Display Color, and set the individual or group surface color. The assigned colors persist when you create the core/cavity.

User Mold Base



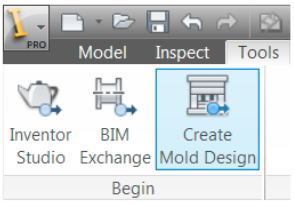
Create an assembly, and use the User Mold Base command to place as a mold base. Before placement: Use options in the dialog box to enable or disable automatic constraints. Use the Mold Base Author command to specify the component type and alignment. If necessary, use the author command to define the mold base after placement.

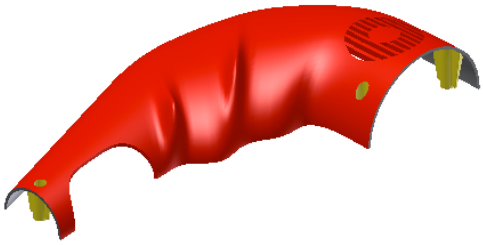
Edit Moldable Part



The command Edit Moldable Part, on the Core/Cavity tab, Parting Design panel, activates the moldable part file (MP) and turns off the visibility of other components. Choose this command to edit the body of the moldable part, and create hole patching and runoff surfaces in the MP file.

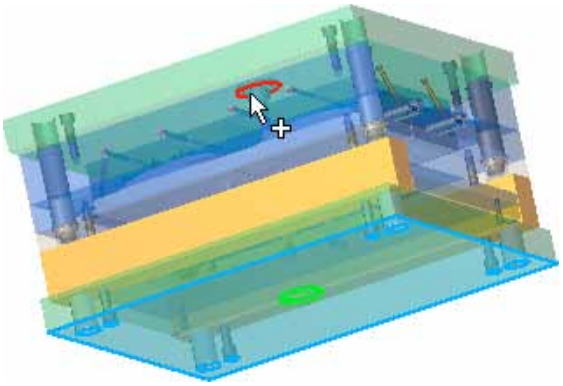
Transition from Part to Mold





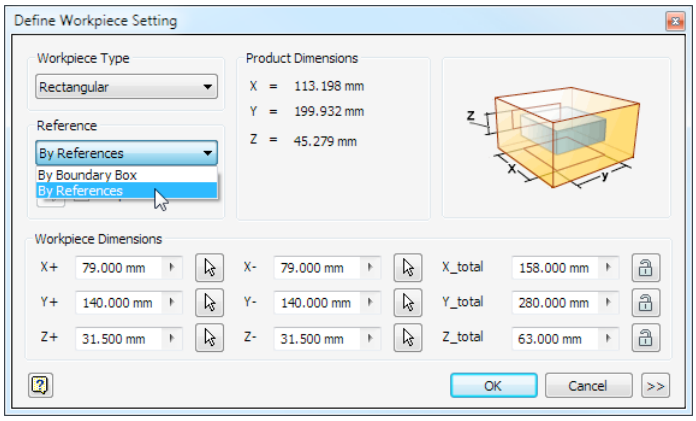
Create Mold Design on the part Tools tab, Begin panel provides a smooth transition between part modeling and mold design. Choose this command to enter the mold design environment directly from the source part file.

Multiple Locating Rings



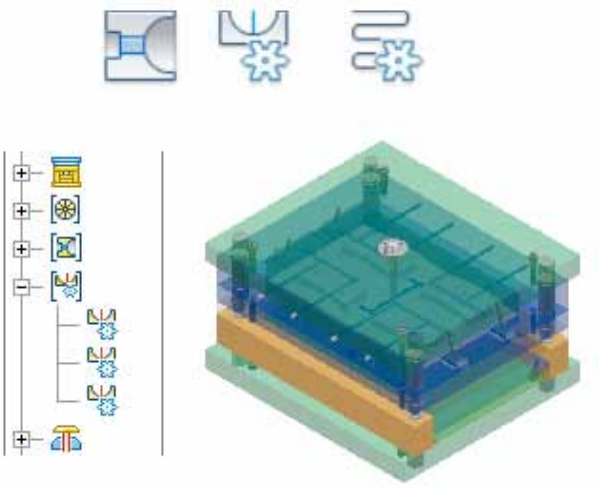
Select a concentric reference and place multiple locating rings in the same command. To place multiple locating rings, select the base face, a concentric reference, and then choose apply.

Define Workpiece Setting Enhancement



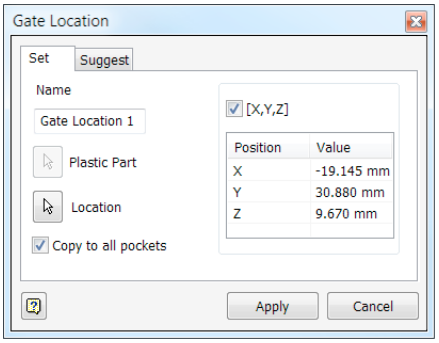
An option, By References, is now added to the Define Workpiece Setting dialog box, Reference drop-down menu. Use the new option to: Define a workpiece based on selected elements of the plastic part. Define a workpiece based on multiple selected elements of the plastic part. Turn on Multiple references to select more than one reference.

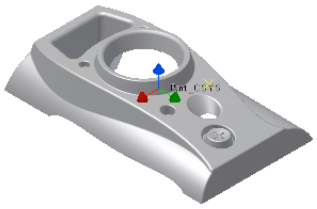
Retain Last Input Value



The commands Gate, Cold Well, and Cooling Channel are enhanced. The dialog box for these commands retains the last input value for the current session.

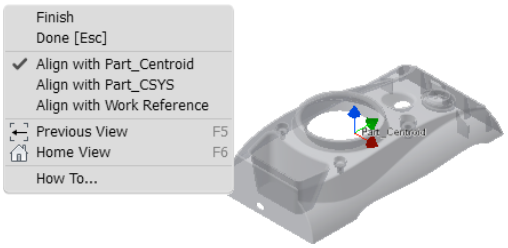
Gate Location X,Y,Z





An option to display and edit the gate location as X,Y,Z values is available in the Gate Location dialog box. To display or edit the value as X,Y,Z coordinates, select the X,Y,Z check box. To display and edit the position as U,V (ratio on an edge) values, clear the check box.

Place Plastic Part

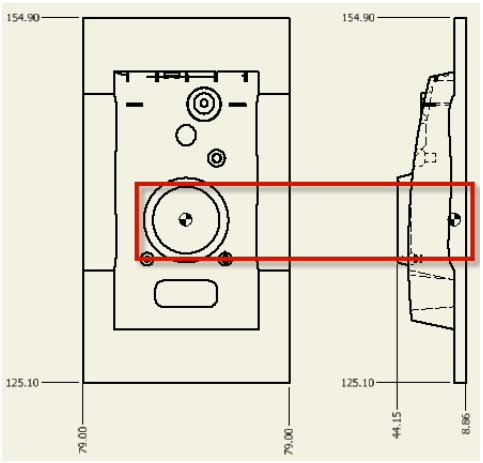


There are three alignment choices for the Plastic Part command.

- Align with Part Centroid (default)
- Align with Part CSYS (coordinate system)
- Align with Work Reference

You can select a UCS or a Work Point to define a Work Reference. Before you place a plastic part, right-click to access the alignment options. Left-click to accept the selection and place the part.

Ordinate Dimensions



You can now use the mold or part coordinate system as the origin for ordinate dimensions. Right-click when you place the plastic part in the mold assembly to specify which coordinate system is used for the mold. Enable Origin of Coordinates in the Drawing Settings dialog box to use the specified coordinate system.

Stay Up to Date

Autodesk gives you more. Gain access to technical expertise, utilize training and support programs direct from Autodesk, stay up to date with the latest product releases, and give us your feedback. Not only does Autodesk want to help you use Autodesk Inventor more effectively but also make sure Autodesk Inventor is working effectively for you.

Subscription

Autodesk® Subscription gives you immediate access to software upgrades and exclusive access to service and support benefits designed to help you get the most out of your Autodesk software. Learn more at www.autodesk.com/subscription.

Product Updates

If you experience an issue with Autodesk Inventor 2012 that has already been solved in a service pack or hotfix, a dialog box appears when you submit the problem to Autodesk, enabling you to immediately install the new service pack or hotfix.

Autodesk Learning and Education

From instructor-led or self-paced classes to online training or education resources, Autodesk offers learning solutions to fit your needs. Get expert guidance at an Autodesk Authorized Training Center (ATC®) site, access learning tools online or at your local bookstore, and validate your experience with Autodesk certifications. Learn more at www.autodesk.com/learning.

Feedback

Autodesk Inventor customers can provide feedback to the Autodesk Inventor development team through several different avenues. For example:

- Provide tips or join newsgroups at www.autodesk.com/inventor
- Keep up-to-date on what's happening in your industry, stay in touch with other industry professionals, and take advantage of a host of online resources at the Manufacturing Community Portal at www.mfgcommunity.autodesk.com
- Talk with your Autodesk Authorized Reseller and support staff

  Your input is crucial to our success and we look forward to receiving your suggestions.

Conclusion

We thank you for your continued support of the Autodesk Inventor family of products and hope you feel we are listening to your needs. We added the new and enhanced functionality to Autodesk Inventor 2012 to help make you more productive, make your company more competitive, and return true value to your bottom line.

Autodesk® Inventor® Product Line Overview

Autodesk Inventor Products 2012: Key Features

Autodesk Inventor mechanical CAD software comes in different product configurations that offer specific levels of functionality to fit your design needs. They all demonstrate Autodesk's focus on helping you create accurate digital prototypes and bring better products to market faster and at lower cost.
